

1. Testing / Deciding

- a. Essay
- b. Resume
- c. Skills
- d. Homework
- e. General knowledge
- f. Job experience

How do we represent?
How do we track progress?
How do we choose what to test?

can make loop with
← hints = tutor

g. Administer questions and show thinking (interviews)

Do we want to use coding interviews or does that usecase make sense?

2. Administering

- a. Pipecat / chat interface

3. Grading part

- a. Given a question, grade based on solution

- b. Determine follow ups

- c. What are we testing?

What is "correct" vs "incorrect"? How do we judge?

Note: We can manually decide what to test. We should be able to visualize it and make test manually so teachers can do this. (Basically we're creating exams can also guide based on lectures)
every part should be modular

4.

Meeting with Philip Su

first validate assessing student
how does it perform standard test

How we know they're learning

alternative from paper to oral

How does it test knowledge

Verbal test on SAT

is it 10x better

show correlation

between good vs bad

SAT/college board

what is correlation between the middle

Sat NO profit to organization

Valuable to business that use oral Exams

Last thought

What is defensible in this business

one challenge AI is growing so
to catch you is growing

first sell to college board
your advantage is your with bluest one

What makes a strong pitch
understands the market or oral exam
longterm Plan (Thesis)

Edtech

* learning

* skill dev.

Ideas

1. Voice agent tutor

* Agents

2. Hey clicky AI tutor * Spatial context

3.

Problem

1. AI is making us dumber

2. Students want better educational outcomes

3.

Idea:

Hugh

- Thesis: HeyLitkey viral right now, poor use for computer though
- Math usually done on paper
- Ipad's popular

- use tablet with pencil to be able to draw / talk to AI

- Can work through examples in handwriting
- Draw math, basically assistant
- Combines written medium (paper equivalent) with AI

Ali:

A canvas that you can submit your homework into and work on it then it can help you fix on it and saves your mistakes and what you did well on then quiz you later for more practice

Simon

L

Proto

"Hey, can you work through an example of this"

- Agent creates new page
- Agent uses handwriting to start working through with you
- User can jump in
- Tutor can guide you, ask you to work through one yourself
- We destroy math museum

PDF

1. annotating / reading

(Muhammad)

①

uses:

- a) grading
- b) question structure / sending

1-1 or 1-many

②

2. Assignment

Plus

blur on question show

★ too often no focused

★ distract away grading

hints
pros
cons

$$\int_x^2 x^3 \rightarrow$$

1. Al works through one at a time
2. Explains, helps student
3. Uses canvas to help student

User Persona

①

John is learning Algebra, but struggles with textbooks

\$\$\$

②

He's used tutors before and learned, but they're expensive

③

He wants to improve at math, in a guided and effective way

???

④

1. Assume -> Assumption -people will find an AI tutor/learning partner effective (for learning math) and it would replicate the effectiveness of a tutor

2. test -> Find a tutor and ask them if a prototype would help them.
OR find a student of math and teach them some new thing -give them a new lesson and watch

-Learn -> refine prototype, change assuming
What is the problem we're solving?

↳ people want to learn math in a more effective Manner without paying for a tutor. (+ outcomes -Price)

MVP

1. $1.2 \times 10 = 20$

2.

3.

Ask 

canvas:
with assignment
(PDF)

- Assignment, can
be exported, submitted, annotated

- Assignment can be generated by AI

Tap to go to large
screen with chat
history

speaking: as it speaks,
text (low opacity) goes
up (above it)

"Let's discuss this
problem. First off,
can you explain what
a y-intercept is?"

Ask 

2. When you talk to the AI, what can it do?
 - a. Chat and respond; answer questions in a Socratic manner
 - b. Draw diagrams, write, work through examples with you.
 - c. Point out examples, organize and point out what resources help.
 - d. Help you understand and work through problems
3. What is a sample flow of the product?
4. Student/user/classroom student: "I'm having issues with this problem. I don't know where to start, and I don't get what to do" (let's say it's for solving a quadratic formula)

SAMPLE FLOW

* note: this is for later. For now use skills

s: "I don't understand this problem, and don't know where to start." [uploaded image]

Tutor: Gauge user understanding, initial knowledge (use memory graph) ask them what they know

The user doesn't know anything

User has some idea

User knows but forgot or no muscle memory
